CARBON TAX

How much will it cost you?

You may or may not support the notion of manmade greenhouse gas emission causing climate change, what is real however, is the global political response to the possibility that it is. Governments are mandating emission reduction, imposing carbon taxes and compliance procedure which will cost you money. Those costs will be particularly felt in the manufacturing sector, with the rising price of external supplied energy, plus the soon to be added tax / cost of in house generated greenhouse gas emissions at A\$23.00p/ton.

Process plants in general running nowhere near their efficiency and effective design parameters, as we had it too good for too long with cheap energy; we let our best practises slip guided by price and not considering the actual cost, the tide is changing as energy prices going up and the carbon tax kicks in.

Now more than ever the issues of implementing energy efficient practises have never been more critical, at STEAM LINK®, we have over a period of time developed our own unique process specific, 'STEAM SYSTEM PERFORMANCE REPORT', establishing a comprehensive documentation / database of any existing steam installation, providing you with real up to date data for implementing cost effective efficiency measures or providing you with a solid base for plant expansion.

With the immediate prospect of efficiency at many points along the steam circuit a considerable reduction of energy intake plus a process performance improvement will be achieved, this translates to cost reduction per unit of production.

For STEAM LINK® clients, it means that there is a simple cost effective pathway, not only saving on energy cost and improve the process performance but also reducing the carbon emission levels, a **WIN - WIN** situation.

Improved process performance - reduced emission
